Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid ubiquinone

Disclosure; SEQ ID NO 6134; 872pp; English.

first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory, antiallergic, antiasthmatic, hypotensive, has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also The invention relates to a novel pharmaceutical composition, which has 

for enhancing the prophylactic or therapeutic respiratory effect of an autiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubliquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences 88888888888**%**

Determining the racing potential of a horse comprises measuring whether grandpaternal or grandmaternal DNA from the selected grandmother DNA is over-represented in the genome of the horse.

Example 2; Page 24; 49pp; English

The invention relates to a novel method for determining racing potential of a horse. The method comprises measuring: whether grandpaternal DNA is over-represented in the genome of the horse; or in the case where one of the grandmothers was selected for breeding on the basis of racing performance, whether grandmaternal DNA from the selected grandmother is over-represented in the genome of the horse which indicates that the horse has good racing potential. The method of the invention is useful for determining the racing potential of a horse or for obtaining a progeny horse with good racing potential. This polynucleotide sequence representation of DNA from male grandparents of the invention represents a PCR primer used in the detection method of over-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an agent that inhibits one or more specific DNA methyl transferase isoforms (but not all DNA methyl transferase isoforms), such as an anti-DNA methyl transferase oligonucleotide or a small molecule inhibitor of DNA methyl transferase. The agents, oligonucleotides, inhibitors and methods are useful for identifying specific inhibition of specific DNA methyl transferase isoforms involved in cell proliferation and/or differentiation, and thus providing a treatment for cell proliferative and/or differentiation, and thus providing a treatment for cell proliferative and/or differentiation disorders, e.g. neoplasia. This polymucleotide sequence represents a human DNA MeTase DNMT 1 oligo relating to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New inhibitors of DNA methyl transferase isoforms, e.g. anti-DNA methyl transferase oligonucleotides or small molecule inhibitors of DNA methyl transferase, useful for treating cell proliferative and differentiation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Length 20;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1; Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an agent that inhibits one or more specific DNA methyl transferase isoforms (but not all DNA methyl transferase isoforms), such as an anti-DNA methyl transferase oligonucleotide or a small molecule inhibitor of DNA methyl transferase. The agents, oligonucleotides, inhibitors and methods are useful for identifying specific inhibition of specific DNA methyl transferase isoforms involved in cell proliferation and/or differentiation, and thus providing a treatment for cell proliferative and/or differentiation disorders, e.g. neoplasia. This polymuleotide sequence represents a DNMT3a oligo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New inhibitors of DNA methyl transferase isoforms, e.g. anti-DNA methyl transferase oligonucleotides or small molecule inhibitors of DNA methyl transferase, useful for treating cell proliferative and differentiation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The invention relates to a method of treating an inflammatory skin disorder in an individual by topically applying an antisense compound targeted to a nucleic acid molecule encoding a human B7 protein. The invention is for treating an inflammatory skin disorder in individual. The skin disorder is psoriasis, contact dermatitis, atopic dermatitis, seborrheic dermatitis, nummular dermatitis, generalised exfoliative dermatitis or eczema. The invention effectively modulates critical costimulatory molecules such as the B7 protein. The present sequence represents a human B7-1 targeted oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, PTEN, MMAC1, TEP1, phosphorothicate; antisense oligonuclectide; inhibition; protein phosphatase; tumour; diagnosis; inflammation; anticancer; anti-inflammatory; anti-infective; infection; ss.
                                                                   topically applying an antisense compound targeted to the nucleic acid encoding human B7 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human PTEN phosphorothioate antisense oligonucleotide #29559.

                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an agent that inhibits one or more specific DNA methyl transferase isoforms (but not all DNA methyl transferase isoforms), such as an anti-DNA methyl transferase oligonucleotide or a small molecule inhibitor of DNA methyl transferase. The agents, oligonucleotides, inhibitors and methods are useful for identifying specific inhibition of specific DNA methyl transferase isoforms involved
                                                                                                                                                                                                                               New inhibitors of DNA methyl transferase isoforms, e.g. anti-DNA methyl transferase oligonucleotides or small molecule inhibitors of DNA methyl transferase, useful for treating cell proliferative and differentiation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 in cell proliferation and/or differentiation, and thus providing a treatment for cell proliferative and/or differentiation disorders, e.g. neoplasia. This polynucleotide sequence represents a human DNA MeTase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ss; human; B7-1; inflammatory skin disorder; antisense; psoriasis; confact defmatitis; atopic dermatitis; seborrheic dermatitis; nummular dermatitis; generalised exfoliative dermatitis; eczema; critical costimulatory molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

New antisense compounds useful for treating, preventing or diagnosing e.g. tumors or inflammation, are targeted to the human dual specificity protein phosphatase (PTEN) sequence.

The present invention describes phosphorothioate antisense

Claim 3; Col 41; 32pp; English.

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ7740 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from differential efficacious responses to and side effects from N.B.             the sequence encoding a human dual specificity protein phosphatase designated PTEN (also known as MAC1 and TEP1), and hybridise specifically to the human PTEN nucleotide sequence given in AAZ91361. The antisense oligonucleotides have anticancer, anti-inflammatory and anti-inflective activities. The phosphorothhoate antisense oligonucleotides can be used for diagnosis, treatment and prevention of PTEN-related diseases, e.g. infections, inflammation and tumours. The present sequence represents a phosphorothhoate antisense oligonucleotide for human PTEN,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel biallelic markers used to construct a high density disequilibrium
  oligonucleotides that are targeted to the 3'-untranslated region (UTR)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human biallelic marker downstream amplification primer SEQ ID NO:9283.
                                                                                                                                                                                                                                                                                                  Gaps

Nucleic acids encoding B7-related polypeptides, i.e. BSL1, BSL2, or BSL polypeptides, useful for treating autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, and psoriasis), and graft versus host

Example 3; Page 101; 179pp; English.

The invention relates to novel nucleic acids encoding B7-related polypeptides include the BSL1, BSL2, or BSL3 polypeptides. The B7-related polypeptides include the BSL1, BSL2, or BSL3 polypeptides, or their soluble fragments. The nucleic acid, polypeptide, and antibodies are useful for treating autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, Hashimoto's thyroiditis, Graves' disease, Crohn's disease, ulcerative collitis, pernicious anaemia and psoriasis. They may also be used to treat tissue, bone marrow, and organ transplantation, and graft versus host disease. ABK24010-ABK24093 represent B7-related proteins, BSL1, BSL2 and BSL3 coding sequences and PCR primers of the invention

The invention relates to a method for amplifying a nucleic acid using Single Primer Amplification (SPA). The method comprises synthesising a comparate nucleic acid containing a predetermined sequence and hairpin structure with the nested oligonucleotide extension reaction. The method is useful for amplifying a nucleic acid, preferably for amplifying a complex library of polypeptides encoded by the sequences. The engineered nucleic acid strand is useful for amplifying a nucleic acid strand by providing a nucleic acid strand by providing a nucleic acid with a predetermined sequence engineered nucleic acid strand of sequence complementary to the predetermined sequence and a hairpin structure between them and contacting the engineered nucleic acid strand with a primer containing at least a portion of the predetermined sequence of a polymerise and nucleotides under conditions suitable for polymerisation to produce a complementary nucleic acid strand. The method of the invention is useful for producing large amounts of a target nucleic acid sequence and for
                                                                                                                                                                                                                                                                          ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention comprises the amino acid and coding sequence of B7-related (BSL2) fusion proteins. The B7-related fusion proteins of the invention are useful for modulating the activation of immune or inflammatory response cells (e.g. T cells). The B7-related fusion proteins are useful for treating or preventing: transplantation rejection; graft versus host disease; asthma; chronic obstructive pulmonary disease; cancers; viral infections (e.g. HIV, herpes or encephalitis); and autoimmune disease (e.g. rheumatoid arthritis, multiple sclerosis or psoriaeis). The present DNA sequence represents a PCR primer that was used in an example of the

This invention describes a novel oligonucleotide which hybridises with and detects a nucleic acid from a filamentous bacteria cell. The filamentous bacteria cell. The filamentous bacteria cell. The filamentous bacteria can include members of the 021N Kanagawa group I, II or III, 021N-like from B1033 EU21, Alisphaera europaea EU24 Nostocoida limicola-like, Alisphaera (europaea, PR23, MC2), Alisphaera MC2 MACOBS-CC Clone 2 (B10 36), Bactothrix amylovora (BU3, EU4, EU9, EU11), Chloroflexus aurantiacus, Curtnnema variabilis (type 0041), Cytophaga, Chloroflexus aurantiacus, Curtnnema variabilis (type 0041), Cytophaga, EPTS Australian 021N isolate (EU21), EPTS Australian isolate EU32 from SAN3, Flexibacter, Herpetosiphon, H. aurantiacus, Leptothrix discophora, Megathrix sidereus EU36 Nostocoida limicolasne (EU24), CU21, Nostocoida limicolasne (EU24), Nostocoida limicolasne (EU24), Nostocoida limicolasne (EU24), CU2), Nostocoida limicolasne (EU24), CU2), Nostocoida limicolasne (EU24), Cu20, Nostocoida limicolasne (EU24), Cu20, Cu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New oligonucleotides are useful to detect filamentous bacteria in samples, particularly in activated sludge.
                                                                                                                                                                                                                                                                                                                                                                                             ss; probe; hybridisation; detection; filamentous bacteria cell;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score 13.2; DB 1; Length 18;

```

```
The sequences given in AAQ37394-406 are primers which were used to amplify and assemble the heavy and light chain variable regions of the antiphenyloxazolone hypridomas NQ2/12.4 and NQ10/12.5. In the first stage, Vh and Vk genes were linked together, and in the second stage the assembled product was amplified from the cell template. This in-cell PCR method can be used for gene linkage analysis, particularly for the cloning of gene combinations that are polymorphic within a population of 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                            Treatment of cell populations, partic. hybridomas - to link together copies of 2 or more non-contiguous DNA sequences to facilitate analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          primer; PCR; polymerase chain reaction; hierarchy; immunoassay; quantitative assay; fragment length; DNA sequencing; p53; mutation; ss.

```
Rapid and cost effective diagnosis of disease-associated mutations in the p53 gene is achieved by employing a selected number of diagnostic tools, in a hierarchy of increasing accuracy and cost per tool, in which each tool detects essentially no false positives. Tests that may be employed, in order of increasing accuracy and cost are: (a) immunoassays; (b) DNA fragment length/quantitiy analysis; and (c) DNA sequencing of regions most likely to harbour point mutations. AAT08667-85 are primers used in DNA sequencing analysis. The primers are generally nested inside the amplification primers (AAT08645-66), i.e. closer to the exon, although in some cases the preferred sequencing primer is in fact the amplification primer. The sequencing primer is conjugated to a fluorescent mol. such as fluorescent, rhodamine or cyannine. The present sequence is used to sequence the sense strand of exon 2, and is a preferred sequencing primer
                                                                                                                                                                                             Testing for disease-associated p53 gene mutation(s) using a hierarchy of assay techniques - e.g. immunoassay, DNA amplification and DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ovary cancer; breast cancer; oncogenesis; metastasis; diagnosis; gene therapy; polymerase chain reaction; PCR; primer; single strand conformation polymorphism; SSCP; ss.

PCR primers (AAT36924-53) were designed to screen the complete coding region (AAT36922) and intron-exon boundaries of the novel human candidate tumour suppressor gene OVCA1. The primer given in AAT36928 is based on the 5' end of exon 3 of the OVCA1 gene. SSCP analysis was used to screen the OVCA1 coding region and intron-exon boundaries in 100 ovarian tumours and 13 tumour cell lines. 15 Mutations, many in the introns flanking exon A, were detected. These appeared to be acquired somatic mutations. Multiple common and rare polymorphisms were identified in the coding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 extension products, which are indicative of positions of selected species of nucleotide in nucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents a primer for exon 2 of the p53 gene. This sequence can be used in the method of the invention for determining the position of at least one selected species of nucleotide, in a region of interest, in a target nucleic acid polymer, in a sample. The method comprises combining the sample with a reaction mixture to synthesise
                                      Tumour suppressor gene, OVCAI - useful to develop prods. for diagnosis, monitoring and therapy of malignant diseases.
                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PCR primer; amplify; pathogen identification; mutation detection; nucleic acid analysis; microorganism characterisation; human; HLA type determination; p53 gene exon 2; ss.

'sing nucleic acid containing sample - comprises performing multiplex fication reaction and reacting amplified fragments in sequencing Analysing nucleic acid containing sample reaction mixture.

Example 4; Page 18; 37pp; English.

amplification primer pairs, one pair for each region to be analysed, to produce a mixture of amplified fragments, and determining the sequence of at least one species of amplified fragment, characterised in that the sequence is determined by combining the mixture of amplification fragments with a sequencing reaction mixture for the production of sequencing fragments, and evaluating the sequencing fragments produced. The method can be used to analyse regions in the mucleic acids in the sample for the presence of mutations, or detect and type microorganisms. This sequence represents a primer for exon 2 of the p53 gene. This sequence can be used in the method of the invention for analysing a nucleic acid containing sample. The method comprises performing a multiplex amplification reaction on the nucleic acids in the sample using

homologue to molecules associated with the Drosophila fused gene. The protein is involved in eliciting an intracellular signal in the human hedgehog-patched (HH-PTC). The protein, its antibodies and pharmaceutical compositions comprising them can be used as medicaments. The presence of a fused gene, cDNA, mRNA, protein or subsequences of these in a fused gene, cDNA, mRNA, protein or subsequences of these in a fused gene, cDNA, mRNA, protein or subsequences of these in a biological sample are useful, e.g. as a marker to assess in vivo and/or in situ RNA transcription and/or translation, in cancer diagnostics, in prophylaxis, etc. The polymucleotide sequence can also be used to derive gene sequences. The labeled probes can also be useful in karotyping analysis as markers of the fused gene. The polymucleotides may also be used in gene therapy methods. The polymptide is useful as a lead compound in the design of analogues and mimics, as well as for screening for agonists and antegonists. The products may also be used for the study of different conditions, such as cancer and development of cancer therapies, the regulation of gene transcription, embryonic repair and tissue repair/wound healing, neurodegenerative diseases, and testicular PCR primers AAX81944-45 were used to amplify cDNA encoding a human function

This process is used to identify biological material such as bacteria or viruses, e.g. to distinguish between ribosomal sequences from different bacteria that are all primed by the same broad-range primers, especially to distinguish between Escherichia coli, Staphylococcus aureus and Neisseria gonorthoea, to prevent unwanted amplification of contaminating bacterial DNA sequences, e.g. in Taq DNA polymerase preparations, for genotyping by blocking amplification of non allotype and to eliminate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to chondrogenesis promoters containing a membrane-bound transferrin-like protein (MTf). Chondrogenesis promoters, chondrogenesis regulators, MTf activators, MTf antagonist-containing chondral differentiation inhibitors are useful in diagnosis, prevention and treatment of diseases due to abnormal chondral metabolism and bone metabolism e.g. bone diseases. The present sequence represents a PCR primer specific for DNA encoding MTf

m Bihain Chumakov I, Abderrahim H, Blumenfeld M, Cohen D,

Set of novel map-related biallelic markers, preferably located on obesity disorder-associated chromosomal regions on chromosomes 3, 10 and 19, useful, for e.g. detecting statistical correlations between marker allele and a phenotype.

Example 2; Page 237; 311pp; English.

The invention relates to a set of novel map-related biallelic markers, preferably located on obesity disorder-associated chromosomal regions on chromosomes 3,10 and 19. The markers are useful for genotyping or estimating the frequency of an allele in a population, for detecting an disease involving drug responses, obesity or disorders related to obesity, such as hyperuricaemia, digestive pathology, hepatic function disorders, cancer, cardiovascular disease, hypertension, hyperlipidaemia, insulin disorders, atheromatous disease and cardiac insufficiency. The markers are useful for detecting a statistical correlation between a biallelic marker and a phenotype. This sequence represents a PCR primer used to amplify a human obesity-associated biallelic marker

Detecting bacteria causing meningitis in cerebrospinal fluid - by amplifying target regions and detecting using panel of probes which includes universal bacterial probe.

Disclosure; Page 12; 65pp; English

```
ö
The PCR primer RW01 was used in conjunction with PCR primer DG74 for amplification of bacterial DNA to yield a ca. 370 bp PCR prod. corresp. to base pairs 1170-1540 of the E. coli 16S rRNA gene. This target region is of sufficient length to encompass two regions of high variability characterised for the 16S rRNA gene, variable regions 8 and 9. The variability in these regions may encompass probes which are to some degree specific to the various species of bacteria found in the cerebrospinal fluid (CSF). See also AAQ37314-60. (Updated on 25-MAR-2003 to correct PN field.)

Method for the detection of bacterial species using probes and primers -allows detection and quantification of antibiotic resistant bacteria in patients, the environment and food.

Claim 66; Page 49; 216pp; English.

The sequences given in AAT28588-59 represent universal primers which were used in the method of the invention for the detection of bacterial species in a sample. These sequences are derived from 165 or 23 ribosomal RNA gene sequences. The method of the invention comprises using probes and/or amplification primers which are specific, ubiquitous and sensitive for determining the presence and/or amount of nucleic acids from selected bacterial species in any sample, where the bacterial nucleic acid comprises a selected traspet region hybridisable with the probes or primers. The method comprises contacting the sample with the

```
Streptococcus pneumoniae, Staphylococcus aureus, Staphylococcus epidermidis, Enterococcus faecalis, Staphylococcus saprophyticus, epidermidis, Enterococcus faecalis, Staphylococcus saprophyticus, Erreptococcus pyogenes, Haemophilus influenzae and Moraxella catarrhalis. These bacterial species are associated with approx. 90% of urinary tract infections and with a high percentage of other severe infections including septicaemia, meningitis, pneumonia, intra-abdominal infections, skin infections and other severe respiratory tract infections. The method may also be used to evaluate a bacterial resistance to beta- lactam
probes or primers and detecting the presence and/or amount of hybridised primers or amplification products as and indication of the presence and/or amount of the bacterial species. This method may be used to detect commonly encountered bacterial pathogens, e.g. Bscheritchia coli, Klebsiella pneumoniae, Pseudomonas aeruginosa, Proteus mirabilis,

Detection of Gram-negative bacterial nucleic acid - by amplification and hybridisation with specified probes, useful for diagnosing Gram-negative pacterial septicaemia.

Example 1; Col 19; 23pp; English.

The present sequence represents primer RWO1 for amplifying a target region of a bacterial nucleic acid. Detecting bacterial nucleic acid agequences in a sample (e.g. blood sample) suspected of containing such a bacterial nucleic acid involves the bacterial nucleic acid containing a selected target region, which is then amplified and the amplified target region hybridises with a probe. This method can be used for detecting fram-negative bacteria in human blood samples. It is particularly useful for diagnosis of Gram-negative bacterial septicaemia. The method can also be modified so that it can detect other bacteria present in blood, or

```
0;
other samples. The method provides for the rapid detection and identification of bacteria, partly because it is not necessary to culture the bacteria first. It also provides less opportunities for a mistake to occur than in the current Gram-staining methods. (Updated on 25-MAR-2003 to correct PF field.)

Leptin receptor, OB-R, polypeptide - useful to treat obesity, optionally in conjuction with treatment for diabetes, high blood pressure and high cholesterol.

Claim 32; Page 118; 171pp; English.

The present sequence represents a specifically claimed primer used in the present invention describing a leptin receptor (GB-R) protein. The OB-R can be used to treat obscibly, optionally in conjunction with a treatment for diabetes, high blood pressure and high cholesterol, or in cosmetic compositions for reducing body weight. It may also be used in agriculture to produce leaner food animals, e.g. beef cattle, swine poultry, sheep, an antibody specific for OB-R can be used to measure the presence of OB-R in a sample, optionally in vivo, while the nucleic acid molecule encoding OB-R can be used to detect defects in the OB-R polypeptide associated with obese phenotypes, or diagnostically to measure its encoded RNA and protein in nutritional disorders. The nucleic acid molecule can be used to antisense nucleic acid molecule, or the antisense with AIDS, cancer or anorexia nervosa

AAT92758-T92817 represent amplification primers for human genes which are used in the chimeric non-human animal of the invention. The chimeric non-human animal of the invention, preferably a mouse, contains a foreign chromosome(s) or chromosome fragment. The animal is produced by obtaining a hybrid cell by fusion of a cell containing the foreign chromosome with a cell having the ability to form microcells. The microcells are prepared, and fused with cells having differentiative pluripotency to form cells having differentiative pluripotency and containing the foreign chromosome. These cells are then introduced into an embryo, which is then implanted and brought to term. The foreign chromosome segment is at least chromosome segment could also contain genes associated with human disease, such as the interleukin-2 gene, and the Huttington's disease contain care and chromosome segment could also contain genes associated with human disease, such as the interleukin-2 gene, and the Huttington's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  gene. The expression of foreign genes (especially human genes) in a non-
human animal is useful for efficient production of proteins, especially
of human antibodies. Particular cells of the chimeric animal which
express the foreign genetic material can be isolated and fused with
myeloma cells to produce hybridomas capable of expressing the foreign
gene (e.g. to produce the antibody)
                                                                                                                                                                          PCR primer; amplify; human gene; chimeric non-human animal; antibody; transgenic mouses, chromosome fragment; hybridoma production; microcell; Huntington's disease gene; pluripotent cell; interleukin-2 gene; myeloma cell; cytochrome b-5 reductase; DIA1; ss.

AAV51864

```
AAV20865-V20991 are PCR primers used in the construction of a novel fusion protein constructed from a papillary renal cell carcinoma (PRCC) associated protein and the transcription factor TFE3 which is used in a method for the diagnosis, prophylactic and therapeutic treatment of papillary renal cell carcinoma. The translocation t(X;1) (p11.2;q21.2) found in PRCC results in a fusion of the TFE3 gene with a new chromosome protein between the N-terminus of PRCC and almost the whole of the TFE3 gene. Normal TFE3 transcripts are no longer produced. Two other fusion partners for TFE3 have also been detected; NonO, from a invX (p11.2; q13-24 or 12) translocation and the PSF splice factor gene, resulting in t(X; 1) (p11.2;p34). These trans-locations define a subgroup of PRCC generally encountered in patients younger than 25
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Pluripotent cell; intrinsic gene; chimeric non-human animal; construction; human; antibiotic gene; cancer cell; embryonic; PCR primer;
                                                                                                                                                                                                                                                              Diagnosing papillary renal cell carcinoma by detecting gene trans-
location - resulting in fusion of TFRB gene with some other gene, also
related vectors, transformed cells, specific binding reagents, peptide(s)
encoded by fusions and therapeutic anti-sense sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         4.6%; Score 13.2; DB 1; Length 20; 33.3%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Zea mays genome in order to detect polymorphic markers. Such markers can be used in the construction of allele-specific primers and probes for amplification or hybridisation, e.g. to determine common or disparate ancestry between 2 or more plants, to monitor the genetic contribution of an ancestral plant, to trace the progeny of proprietary plants, in certification of a hybrid plant or to identify the progeny of a back-crossed plant with an ancestral plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAV51705-V52008 are reverse PCR primers used to amplify fragments of the

cells containing foreign chromosomes or fragments - and nonhuman chimeric animals constructed using them and expressing foreign genes such as human antibiotic genes. Pluripotent

Example 5; Page 40; 217pp; Japanese.

The present internation describes a method of obtaining putniputorent certis containing foreign chromosomes or their fragments (preferably at least 670 kb in length, especially more than 1000 kb) by preparing cancerous cells containing the foreign chromosomes or fragments, then fusing these with pluripotent cells such as embryonic stem cells, embryonic productive cells, embryonic cancer cells or their mutants. Also described are: (1) a method of obtaining hybridoma cells by fusing a cell with a high ability to produce hybridoma cells (such as mouse A) cells) with a cell containing the foreign chromosomes or fragments (such as normal human diploid cells); (2) a method of utilising pluripotent cells to produce chimeric and transgenic non-human animals (especially mammals such as mice) which can express the foreign chromosomes or fragments controlled; and (3) chimeric animals, their offspring and tissues and cells derived from the offspring production of monoclonal antibodies for inventions can be used for the production of monoclonal antibodies for chumans. They can also be used in the production of chimeric and chumans. They can also be used in the production of chimeric and chumans as modelals for the study of human diseases. AMY52755 to AAV52828 are open armines used in every model or the production. The present invention describes a method of obtaining pluripotent cells PCR primers used in examples from the present invention

New anti alpha_v beta_3 vitronectin receptor antibodies - used for

```
amplification of a synthetic gene (see AAV1801) encoding a portion of the murine D12 monoclonal antibody heavy chain variable region (WH) that is modified in humanised D12 VH D12HZHC 1-0. The amplified DNA was ligated into pCR2000 vector, and a DNA fragment from this vector was utilised in the construction of an expression vector for humanised D12 VH (see AAV17199). D12 is a murine anti-human alpha-v beta-3 virronectin receptor monoclonal antibody. Humanised D12 antibodies of the invention can be used for passive immunotherapy of disorders mediated by the alpha-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Vaccine, eye disease, conventional trachoma, nonendemic trachoma, paratrachoma, inclusion conjunctivitis, genital disease, perihepatitis, nongonococcal uretritis, epidymitis, cervicitis, salpingitis, PCR primer, bartholinitis, pneumopathy, venereal lymphogranulomatosis, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PCR primers AAZ01426-Z06209 were uged to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (See AAZ01425). These ORFs encode polypeptides (see AAZ04574-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases. e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion
immunotherapeutic treatment of e.g. diabetic retinopathy, inflammatory disorders, atherosclerosis, restenosis, cancers or osteoporosis.
                                                                                                                                                                                                                                                               beta-3 vitronectin receptor, e.g. restenosis and angiogenic-related
                                                                                               SBA884 and SBA843 (see AAV71814) were used in the PCR
                                                                                                                                                                                                                                                                                                                                                        4.6%; Score 13.2; DB 1; Length 20; 83.3%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          thioredoxin and thioredoxin reductase gene which have cytostatic activity and are useful for inhibiting tumour growth and metastasis in mammals. They may also be used as hybridization probes to detect the presence of the thioredoxin and thioredoxin reductase mRNAs in mammalian cells. They may also be used as molecular weight markers. The antisense of oligonucleotides are nuclease resistant due to the presence of phosphorothioate internucleotide linkages. AAZ00504 2200543 represent oligonucleotide primers capable of binding to human thioredoxin reductase

                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents a PCR primer for a human leukocyte antigen-A (HLA-A) allele, and can be used in the methods of the invention. The method are for the distinction of HLA-A allele type. In the first method a set of primers corresponding to each group specific to the base sequence common to each gene in at least one specific group consisting of specific HLA-A allele group is used to carry out a PCR to amplify selectively the HLA-A allele group in each specific group as a group. In the second method the amplified product obtained by the PCR is developed by electrophoresis and the presence of an amplified DNA band of a specific size is confirmed to distinct a specific type of the HLA-A allele group as a group. Further, in the second method, if a specific group as a group. Further, in the second method, if a specific type of HLA-A allele group is distinguished the following method, are further carried out: RFLP method, PCR-RFLP method, SSOP method, PCR-RSOP method, The methods are further carried out: RFLP method. The methods can be used for the diagnosis of HLA-A type in humans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ó

AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (See AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX34894 - AAX35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae especially where the vector directs the expression of a neutralising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Antisense oligonucleotide, phosphorothioate, TNFalpha; cytokine; inhibit; tumour necrosis factor alpha; inflammatory bowel disease; diabetes; rheumatoid arthritis; infectious disease; multiple sclerosis; hepatitis; pancreatitis; atopic dermatitis; allograft rejection; autoimmune disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ..

```
invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallello markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               pharmaceutical agents acting on a disease as well as other treatment. N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel biallelic markers used to construct a high density disequilibrium map of the human genome.
                                                                                                                                      Novel biallelic markers used to construct a high density disequilibrium
                                                                                                                                                                                                                                                                AAZ65654 to AAZ69578 represent human biallelic markers from the present

                                                                                                                                                                                                                                                                                                                                                         targets a region of the human tumour necrosis factor alpha (TNFalpha)

targets a region of the human tumour necrosis factor alpha (TNFalpha)

nucleotide sequence. TrRalpha is an important cytokine that plays a role
in host defence. It is produced mainly in macrophages and monocytes in

response to infection, invasion, injury or inflammation. Overexpression

of TNFalpha can result in disease states, particularly in infectious,

inflammatory and autoimmune diseases. The invention relates to antisense

oligonucleotides, such as that represented by the present sequence which

are capable of modulating that represented by the present sequence which

are capable of modulating that represented by the present and may

also optionally contain at least one 2'-O-methoxyethyl modification. The

oligonucleotides are useful for modulating the expression of human

TNFalpha in cells and tissues, reducing a human cell inflammatory

cresponse, reducing the blood glucose level in a human and treating a

chample a disease or condition associated with TNFalpha. Examples of

diseases associated with TNFalpha include diabetes, inflammatory bowel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          infectious disease, hepatitis, atopic dermatitis or allograft rejection. The antisense oligonucleotides are also useful for modulating the function of a selected nucleic acid sequence in adipose tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                             This sequence represents an antisense oligonucleotide sequence which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human biallelic marker upstream amplification primer SEQ ID NO:7138
                                                                                                                                                                       Oligonucleotide for treating diseases associated with human tumor necrosis factor-alpha (TNF-alpha) such as, diabetes and rheumatoid arthritis, comprises nucleotide sequence complementary to intron of nucleic acid encoding TNF-alpha.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   multiple sclerosis, pancreatitis, rheumatoid arthritis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human genome; biallelic marker; high density disequilibrium map; genomic map; haplotype; phenotype; polymorphic base; genotyping; haplotyping; hybridisation; identification; characterisation; amplification; single nucleotide polymorphism; SNP; PCR primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ..

The method comprises: (a) fusing a microcall comprising the foreign chromosome or chromosome fragment, with a cell having a high efficiency for homologous recombination; (b) marking the desired site of insertion of the foreign chromosome using a targeting vector; and (c) inducing deletion or translocation at the marked site. Transposinic animals produced by the method are useful to provide disease models and knockout animals, and in the production of human proteins, particularly human antibodies. This sequence is used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Producing a cell containing modified foreign chromosomes, useful for the generation of transgenic animals.
                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel method of producing cells containing a modified foreign chromosome or chromosome fragment. The method comprises:

(a) fusing a microcall comprising the foreign chromosome or chromosome fragment, with a cell having a high efficiency for homologous recombination; (b) marking the desired site of insertion of the foreign chromosome using a targeting vector; and (c) inducing deletion or translocation at the marked site. Transpenic animals produced by the method are useful to provide disease models and knockout animals, and in the production of human proteins, particularly human antibodies. This sequence is used in the method of the invention
                                                                                                                                                                           Foreign chromosome; microcell fusion; homologous recombination; antibody; targeting vector; transgenic animal; disease model; knockout animal;
                                                                                                                                                                                                                                                                                                                                                                                       Producing a cell containing modified foreign chromosomes, useful for the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is an oligonucleotide used for antisense modulation of interleukin-5 (IL-5) signal transduction. Oligonucleotides were designed to target nucleic acids encoding IL-5 and IL-5 receptor-alpha. The antisense oligonucleotides may be used for the treatment of diseases associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor-alpha expression. Such diseases include asthma and eosinophilic syndrome. The oligonucleotides are also useful for research uses and to prevent or delay infection, inflammation or tumour formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antisense oligonucleotide compound used to treat asthma and eosinophilic syndrome in humans modulates interleukin-5 signal transduction.
                                     cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antisense oligonucleotide (WH26) directed against preproendothelin-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ó

The present sequence is an antisense oligonucleotide. This sequence is directed against the mRNA of the Corticotropin Releasing Factor subtype-2 (CRF_2) receptor, and hence substantially reduces CRF_2 receptor expression in the brain. CRF is known to play an important part in controlling the pituitary-adenocortical system and in mediating the behavioural, autonomic and immune responses to stress. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel compound for diagnosing, preventing and treating immune disorders, comprising an oligonucleotide that specifically hybridizes with a nucleic acid sequence encoding B7 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention provides sequences of antisense oligonucleotides targeted at the murine and human B7-1 and B7-2 coding and mRNA sequences. The antisense sequences have phosphorothioate backbones and some
                                                                                                                                                              sequence can be used to treat psychiatric disorders such as anxiety, obsessive-compulsive disorder, panic disorders, post-traumatic stress disorder, phobias and depression. The present sequence can also be used in screening assays to determine compounds that have activity for the treatment of the psychiatric disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               nucleotides are 2'-methoxyethoxy residues. The sequences can be used in the treatment of inflammatory and autoimmune disorders, including asthma, juvenile diabetes mellitus, myasthenia gravis, Graves' disease, rheumatoid arthritis, allograft rejection, inflammatory bowel disease,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0
                                                                                                                                                                                                                                                                                                                       Antisense oligonucleotides directed against human preproendothelin-1 can be used to inhibit the synthesis of preproendothelin-1 and endothelin-1. Combinations of active antisense oligonucleotides achieve a greater effect than individual antisense oligonucleotides. The antisense oligonucleotides have applications for treating lung disease such as pulmonary hypertension, obliterative bronchilolitis, asthma or chronic obstructive pulmonary disease, they are also useful for treating diseases caused or aggravated by excess production of endothelin. The antisense oligonucleotides are described in GENESEQ records AAA54136-A54157 and AAA54192-A554205. This antisense oligonucleotide is designated WH26
                                                                                                                                                                             Antisense oligonucleotides complementary to human preproendothelin-1 mRNA and capable of inhibiting synthesis of preproendothelin-1 useful for treating lung diseases such as pulmonary hypertension and asthma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CRF2; receptor; antisense oligonucleotide; psychiatric disorder; anxiety; Corticotropin Releasing Factor; pituitary-adenocortical system; phobia; obsessive-compulsive disorder; panic disorder; depression;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Popoff I,
The present invention describes an antisense compound (I) up to 30 nucleobases in length, where (I) inhibits expression of daxx (also known as Fas binding protein. CENP-C binding protein. (also death associated protein 6 and EAP for Ets-1 associated protein. (I) has cytostatic and antiinflammatory activity, and can be used in antisense therapy and as a modulator of daxx. (I) is useful for inhibiting the expression of daxx in therapeutics for the treatment of diseases associated with the expression of daxx in prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation and as research reagent. The present sequence represents an inhibitory human daxx antisense phosphorothicate oligonucleotide which

                                                                                                                                                                                                                      The invention relates to antisense oligonucleotides targeted to human PARP nucleic acid and inhibiting expression of human PARP. PARP (Poly (ADP-ribose) polymerase plays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonucleotide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, neurological (e.g parkinsonism, meningitis-associated intracranial architics) and disbetes. The present sequence is an antisense
                                                          Antisense compound useful for treating hyperproliferative, neurological, inflammatory and autoimmune disorders and diabetes inhibits human PARP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The invention relates to detecting target bacterial species suspected to be present in a sample, comprising contacting nucleic acids of target be bacterial species with an amplification primer pair derived from a bacterial species but ubiquitous for different strains, amplifying the bacterial species but ubiquitous for different strains, amplifying the cucleic acid and detecting the presence or amount of an amplified sequence as an indication of the presence or amount of the target bacterial species. The invention includes primers and probes (ABA76862-CC BABA7684) against the target bacterial species, espeially B. coli, CK. preumoniae, P. aeruginosa, P. mirabilis, S. pneumoniae, S. aureus, C. S. epidermidis, B. faecalis, S. saprophyticus, S. pyogenes, H. influenzae, C. A. suspected to be present in a sample which is obtained from human patients, animals, environment or food, and which consists of one or more patients, animals, environment or food, and which consists of the bacterial genes encoding resistance to antibiotics such as bla(fem), bla(fbh), bla(fbh), addb, aacdl, aacd
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Method for detecting target bacterial species in a sample, comprises detecting the presence or amount of bacterial nucleic acid amplified by a primer derived from bacterial DNA, specific for the target bacterial

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides a composition containing 4 dNTPs and at least one ddNTP and a thermally stable polymerase which incorporates ddNTPs into an extending nucleic acid polymer at a rate of not less than 0.4 times the rate of dNTP incorporation. This can be used with the PCR primers provided in the invention to detect the presence of microorganisms, such as Chlamydia trachomatis, HIV or human papillomavirus, in a sample. In addition, it can be used to detect mutations in a specific gene, to determine HLA type, and to produce sequencing fragments for further study

```
The present invention describes a method of inentifying the presence of a plurality of genetic markers in a subject, involving generating extension products using PCR primers flanking the plurality of markers, separating the extension products depending on their melting temperatures, and analysing them to determine the presence or absence of each genetic analysing them to determine the presence or absence of each genetic analysing them to determine the presence or absence of each genetic flanking from the diagnosis of genetic diseases, including familial hypercholesterolaemia, cystic filtorosis, Tay-Sachs, thalassaemia, sickle cell disease, phenylketonuria, galactosaemia, fragile X syndrome, sickle cell disease, phenylketonuria, galactosaemia, fragile X syndrome, maturity onset diabetes, cystinuria, methylmolonic acidaemia, urea cycle disease, acaptonuria, hypolaeraes, hereditary haemochromatosis, content of the proposis coli, hereditary nonpolyposis colorectal cancer, Huntington's disease, adilt polycystic kidney disease, argininaemia, chunchington's disease, adilt polycystic kidney disease, argininaemia, chunchington's disease, adilt polycystic kidney disease, alpha-1-

cuntirypsin deficiency, Duchenne muscular dystrophy, Marfan's syndrome, chuntington's disease, leber's hereditary optic neuropathy, MCAD, canavan's disease, retinitis pigmentosa, Bloom syndrome, Fanconi anaemia

cor Neimann Pick disease. The present sequence is one of the PCR primers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                          Detecting multiple genetic markers in one assay, useful to simultaneously detect a number of genetic disorders, comprises generating extension products and separating them on the basis of melting behavior is.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The invention relates to isolated genes (Gene 216) from human chromosome 20p13-p12 and the proteins they encode. The nucleic acids and proteins may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate Gene 216 expression. For example, the nucleic acids (or vectors) and proteins may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of gene 216 by expressing inactive proteins or to supplement the patients own production of Gene inactive proteins. Additionally, the nucleic acids may be used to produce the secreted Gene 216 protein, by inserting the nucleic acids into a host complementary sequences may also be used as DNA probes in diagnostic conplementary sequences may also be used as DNA probes in diagnostic complementary sequences may also be used as DNA probes in need of complementary sequences may also be used as DNA probes in need of complementary sequences and anterfore which patients may be in need of confourtion of antibodies against Gene 216 and in assays to identify and antibodies against Gene 216 and in assays to identify and antagonists may also be used to down regulate expression and activity. The anti-Gene 216 antibodies may also be used as diagnostic against Gene 216 proteins in samples of the production of antibodies may also be used to down regulate expression and activity. The anti-Gene 216 antibodies may also be used as diagnosed and antagonists may also be used to down regulate expression confourtion. The primers are used in the physical mapping of the gene confourtion. The primers are used in the physical mapping of the gene confouration alpolymorphism (SSCP) analysis (ABZ72081-ABZ7288), conformational polymorphism indentification using single strand conformational polymorphism (SSCP) analysis (ABZ72011-ABZ7288)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; Gene 216; chromosome 20p13-p12; antiasthmatic; anorectic; antiinflammatory; gastrointestinal; gene therapy; vaccine; asthma; obesity; inflammatory bowel disease; primer; ss.

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. to array the multiwell close and lateral directions; (f) the mixed clones are cultured and the resultant cultures are amplified broducts; (h) the clones in the multiwell creating are detected from the amplified products; (h) the clones in the multiwell care detected from the amplified products; (h) the clones in the multiwell care detected from the amplified products; (h) the clones in the multiwell care detected from the amplified products; (h) the clones in the multiwell care detected from the amplified products; (h) the clones in the multiwell care detected from the amplified products; (h) the clones are care detected from the amplified products; (h) the clones are care detected from the amplified products; (h) the clones are multiwell care detected from the amplified for the detected result; and (i) the clones are Human; chromosome 1p36-35; chromosome 21q22.1; genetic analysis; genome; Human; chromosome 1p36-35; chromosome 21q22.1; genetic analysis; genome; reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL42957 to ABL45322 represent PCR primers for human chromosome 1936-335 DNA, and ABL45323 to ABL45634 represent PCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention 4.6%; Score 13.2; DB 1; Length 20; 13.3%; Pred. The nucleic acids and proteins associated with inappropriate Gene 216 expression. For example, the nucleic acids (or vectors) and proteins may be used to treat disorders associated with inappropriate Gene 216 expression. For example, the nucleic acids (or vectors) and proteins may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of gene 216 by expressing inactive proteins or to supplement the patients own production of Gene secreted Gene 216 protein, the nucleic acids may be used to produce the secreted Gene 216 protein, the nucleic acids may be used to produce the secreted Gene 216 protein, the patients of similar nucleic acids and culturing the cell to express the protein. The nucleic acids and complementary sequences may also be used as DNA probes in diagnostic complementary sequences may also be used as DNA probes in diagnostic complementary sequences and quantitate the presence of similar nucleic acid sequences in samples and therefore which patients may be used as antigens in capturing therefore which patients may be used as antigens in modulators of Gene 216 protein may also be used as antigens in modulators of Gene 216 protein may also be used as diagnostic and antagonists may also be used to down regulate expression and activity. The anti-Gene 216 antibodies may also be used as diagnostic agents for detecting the presence of Gene 216 proteins in samples (e.g. by enzyme linked immunosorbant assays to EliSA). Disorders that may be revented diagnosed and/or treated by the above methods include, for example asthma, obesity and inflammatory bowel disease. The present sequence is that of a Gene 216 related primer used in examples of the invention. The primers are used in the physical mapping of the gene (ABZ72067-ABZ72088), polymorphism identification using single strand conformational polymorphism (SSCE) and absorbance of the protein protein and generating ( ö Isolated genes (Gene 216) from human chromosome 20p13-p12 and the proteins they encode, useful for the prevention, diagnosis and treatment of asthma, obesity and inflammatory bowel disease. The invention relates to isolated genes (Gene 216) from human chromosome Gaps . 0 4.6%; Score 13.2; DB 1; Length 20; 33.3%; Pred. Novel jAZF1, jjAZ1 or jAZF1/jjAZ1 polypeptides useful as immunogens or antigens to raise or test anti-jAZF1, jjAZ1 or jAZF1/jjAZ1 antibodies.

Example 8; Page 58; 76pp; English.

The present invention relates to a new jAZPI (juxtaposed with another zinc finger), jjAZI (joined with jAZPI) or jAZFI/jjAZI polypeptide. The methods of the invention can be used to identify a compound which controls proliferation of endometrial stroma, by expressing jjAZ in the compound, and determining whether the compound affects expression of jjAZ. jAZPI, jjAZI or jAZFI/jjAZI polypeptides are useful as immunogens or attignes to raise or test anti-jAZPI, jjAZI or jAZFI/jjAZI antibodies. The invention can be used as bait proteins in a two hybrid assay or three hybrid assay to identify other proteins which bind or interact with jAZPI/jjAZI-binding proteins. JAZFI, jjAZI or jAZFI/jjAZI molecules are useful for identifying the origin of tumour and as tumour marker protein to verify that a stromal tumour is from conformer and late of the interact with jAZPI/jjAZI should not interact with jAZPI/jjAZI-binding proteins. JAZFI, jjAZI or jaZPI/jjAZI conformatility as the or interact with jAZPI/jjAZI-binding proteins. JAZFI/jjAZI or jaZPI/jjAZI and also for treating endometrial stromal tumours. The conformation or pregnancy, and also for treating endometrial stromal tumours. The conformation or pregnancy and also for treating endometrial stromal tumours. The conformation or pregnancy and also for treating endometrial stromal tumours. The conformation or pregnancy and also for treating endometrial stromal tumours. The conformation or pregnancy and also for treating endometrial stromal tumours. The conformation or pregnancy and also for treating endometrial stromal tumours. present nucleic acid sequence represents a PCR primer that was used in the methods of the invention for amplification of the human jAZF1 gene located on chromosome 7

Example 6; Page 35; 54pp; English.

Single Primer Amplification (SPA). The method comprises synthesising a template nucleic acid containing a predetermined sequence and hairpin structure with the neeted oligonuclectide extension reaction. The method is useful for amplifying a nucleic acid, preferably for amplifying a family of related nucleic acid sequences to build a complex library of polypoptides encoded by the sequences. The engineered nucleic acid strand by providing a nucleic acid with a predetermined sequence engineered nucleic acid strand of structure between them and contacting the engineered nucleic acid strand structure between them and contacting the engineered nucleic acid strand with a primer containing at least a portion of the predetermined sequence and a hairpin structure between them and contacting the presence of a polymerase and nucleotides under conditions suitable for polymerisation to produce a complementary nucleic acid strand. The method of the invention is useful for producing large amounts of a target nucleic acid sequence and for amplifying simultaneously more than one different target nucleic acid sequence containing to the invention of polymucleotide sequence represents an oligonucleotide relating to the invention relates to a method for amplifying a nucleic acid using invention

Treating a disorder associated with corticotropin releasing factors, e.g. psychiatric disorders, involves administering CRF1 and CRF2 receptor ligands or CRF1 receptor ligand and CRF2 antisense oligonucleotide.

```
method involves administering CRF1 and CRF2 receptor activities. The method involves administering CRF1 and CRF2 receptor ligands, or CRF1 creeptor ligand and CRF2 antisense oligomucleotides. The antisense oligomucleotide is composed of chimeric sequences, where 10-70% of the 2, oligomucleotide phosphorothicate residues are replaced with modified mucleotide residues. The invention is useful for treating psychiatric disorders e.g. anxiety, obsessive-compulsive disorder, panic disorder, post-traumatic stress disorder, phobia and other disorders including head trauma, spinal cord trauma, ischeemic neuronal camage (e.g. cerebral ischaemia such as cerebral hippocampal ischaemia), excitotoxic neuronal damage, epilepsy, stroke, stress induced immune dysfunctions, phobias, muscular spasms, Parkinson's disease, Huntington's disease, urinary incontinence, senile dementia of the Alzheimer's type, multiinfarct dementia, amyotrophic lateral sclaerosis, chemical capendencies and addictions (e.g. dependencies on alcohol, cocaine, heroin, benzodiazepines, or other drugs, and hypoglycaemia. The present content mann.
                                                The invention relates to a method of treating disorders associated with

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation coodon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entitliflammatory steroid and ubiquinome. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of in a control of the composition in a subject, for reducing levels of in a control of the composition in a control of the composition in a control of the composition of the composition of the composition of the composition in a subject, for reducing levels of an entitle control of the composition of the composit lung surfactant in a subject's tissue, or treating bronchoconstriction, uninflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO ftp.wipo.int/pub/published pct_sequences

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Disclosure; SEQ ID NO 4752; 872pp; English.

first active agent comprising an oligonuclectide antisense to the intriation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entinflammatory steroid and ubiquinone. A composition of the invention has antisense gene therapy. The composition of the invention care in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an entilinflammatory steroid in a subject, for reducing levels of or reducing sensitivity to adenosine, reducing levels of adenosine creeptor, producing bronchodilation, increasing levels of depiction, controlling surfactant in a subject stissue, or treating bronchodilation, increasing levels of depiction, lung allergies, or a respiratory disease or condition, or lung inflammation, but was obtained in electronic format directly from WIPO after all or the printed in the printed or th invention relates to a novel pharmaceutical composition, which has a ftp.wipo.int/pub/published_pct_sequences

Aguilar D; Pabalan J, Katz E, ŝ Li Y, Sandrasagra A, Tang L, Shahabuddin Nyce JW, 1 Miller S,

WPI; 2003-229219/22.

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Disclosure, SEQ ID NO 13678, 872pp, English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' incron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or neasal arrway dysfunction and a second active agent comprising an entinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also antiinflammatory steroid in a subject, for reducing of depleting levels of cor enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of adenosine lung surfactant in a subject, stissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from MIPO at ftp.wipo.int/pub/published_pct_sequences

Cytomegalovirus.

WO2003016495-A2

The invention discloses a non-human transgenic animal having incorporated into its genome at least one copy of a transgene encoding a primate bradykinin B 1 receptor gene, or its functional equivalent, such that the transgenic animal demonstrates a humanised B 1 bradykinin receptor (hB1) occupancy or binding profile. The transgenic animal, preferably receptor modulators as well as providing a system for the assessment of the pharmacodynamic properties of B 1 bradykinin receptor modulators of But bradykinin receptor modulators. Such as antagonists or agonists of receptor activity. The B2 and B1 bradykinin receptors are members of the superfamily of 6-protein coupled bradykinin receptors are members of the superfamily of 6-protein coupled bradykinin receptors are members of the superfamily of 6-protein coupled bradykinin receptors are members of the superfamily of 6-protein coupled bradykinin receptors are members of the superfamily of 6-protein coupled bradykinin receptors are members of the superfamily of 6-protein coupled bradykinin receptors are members of the superfamily of 6-protein coupled bradykinin braceptors are members of the superfamily of 6-protein coupled bradykinin braceptors are members of the superfamily of 6-protein coupled bradykinin braceptors are members of the superfamily of 6-protein coupled bradykining the superfamily of 6-protein coupled bradykinin receptors (GPCR). The sequence presented is a PCR primer, CMV 381F, which was used to detect transgene insertion during creation of a transgenic New non-human transgenic animal, useful as a specific receptor occupancy model for modulators of the B1 bradykinin receptor, or as an animal mode. system for assessing the pharmacodynamic properties of B1 bradykinin Sequence 20 BP; 3 A; 5 C; 6 G; 6 T; 0 U; 0 Other; Gould RJ, Pettibone DJ; Example 2; Page 24; 66pp; English. 19-AUG-2002; 2002WO-US026368. 20-AUG-2001; 2001US-0313531P. New non-human transgenic animal, useful as a specific receptor occupancy model for modulators of the B1 bradykinin receptor, or as an animal mode system for assessing the pharmacodynamic properties of B1 bradykinin

Example 4; Page 27; 66pp; English.

The invention discloses a non-human transgenic animal having incorporated bradyknin bal receptor gene, or its functional equivalent, such that the transgenic animal demonstrates a humanised B l bradykinin receptor (hB1) occupancy or binding profile. The transgenic animal, preferably reassenic rat, can also be used for the discovery of B l bradykinin receptor captor an also be used for the discovery of B l bradykinin treceptor modulators as well as providing a system for the assessment of the pharmacodynamic properties of B l bradykinin receptor modulators. But an agonists of receptor activity. The B2 and B1 bradykinin receptors are members of the superfamily of G-protein coupled receptors (GPCR). The sequence presented is a PCR primer, #!, which was also and any activity and account of the superfamily of G-protein coupled the demonstration of the during and any activity and account of the during and any account of the during any account of the during any account of the during and any account of the during creation of a transgenic rat

Identifying the presence or absence of a mutation or polymorphism in a subject, useful for diagnosing genetic diseases, comprises generating extension products and analyzing the melting behavior of the mixed DNA

```
The Invention relates to a method to its interior of a mutation or polymorphism in a subject for identifying the presence or absence of a mutation or polymorphism in a subject for diagnosing genetic diseases, e.g. cystic fibrosis, Tay-sachs, can be presence or absence of several genetic markers in a subject for diagnosing genetic diseases, e.g. cystic fibrosis, Tay-sachs, familial hypercholesterolaemia (FH), thalassaemia, sickle cell disease, phenylkerouria, galactoseemia, fragile X syndrome, haemophilia A, myotonic dystrophy, medium-chain acyl CoA dehydrogenase, maturity onset diabetes, cystinuria, methylmolonic acidaemia, urea cycle disease, chrembocytopaenia, Gauchers disease, tyrosinaemia adenomatous chrembocytopaenia, dauchers disease, tyrosinaemia adenomatous colypopis coli (APC), adult polycytic kidney disease, buchenne muscular dystrophy, alpha-1-antitrypsin deficiency, hereditary non-polyposis coleccal cancer, Huntington's disease, neurofibromatosis, Marfau's coleccal cancer, entitity psin deficiency, nerofibrome, osteogenesis imperfecta, retinoblastoma, Freidrich's ataxia, chaemoglobinopathies, MCAD, Canavan's disease, Leber's hereditary optic neuropathy, retinitis pigmentosa, Bloom syndrome, Franchie anaemia, or phosphate uridyl transferase (GALT) specific PCR primer used to
                                                                                         The invention relates to a method for identifying the presence or absence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               4.6%; Score 13.2; DB 1; Length 20; 33.3%; Pred. The invention relates to a novel method for identifying subjects at risk of developing thrombotic thrombocytopenic purpura (TTP) disease, comprising providing nucleic acid having a disintegrin and metalloproteinase containing thrombospondin 1-like domains 13 (ADAMTS13) gene from a subject, and detecting the presence or absence of one or wariations in the ADAMTS13 gene. The method of the invention has thrombolytic and haemostatic activity. The methods and compositions of the present invention are useful for the diagnosis and treatment of, and/or analyaing risks for thrombocit thrombocytopenic purpura. The present sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

Novel antisense compound for treating disease/condition e.g. eosinophilic syndrome or asthma associated with interleukin-5 or IL-5 receptor expression or IL-5 signal transduction, modulates IL-5 signal ransduction.

Example 23; Page 22; 77pp; English.

The invention relates to an antisense compound of 8-30 nucleobases in length, which modulates interleukin (IL)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense oligonuclectide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form wersus soluble form of IL-5 receptor a. The antisense compound is useful for modulating IL-5 signal transduction, modulating expression of mammalian IL-5 or modulating the expression of mammalian stiesuses, for altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or tissues, treating a mammalian having a disease or condition associated with IL-5 signal transduction,

syndrome

This invention relates to a novel isolated nucleic acid, gene 216, identified from human chromosome 20p13-p12. The invention also discloses regions of the 216 gene that contain single nucleotide polymorphisms (SNP's) which may be used as markers for disease susceptibility or severity. The nucleotides of the invention may have antiasthmatic, antiinflammatory or anorectic activities and may be used in gene therapy. The nucleic acids, antibodies or its fragments are useful for disquosing, preventing or treating a disorder, who has respiratory diseases (e.g. asthma, bronchial hyper-responsivenes, chronic obstructive pulmonary

disease or adult respiratory distress syndrome), obesity, or inflammatory bowel syndrome. The nucleic acids are also useful for identifying increased susceptibility of a subject to the disorders mentioned. The nucleic acids can also be used as primers and templates for the recombinant production of disorder-associated peptides or polypeptides, for chromosome and gene mapping, or for tissue distribution studies. The present sequence represents a gene 216 specific PCR primer used in the

chromosomes (chromosomes 1 and 7) by a novel RNA recombination mechanism involving trans-splicing of the two discontinuous precursor mRNAs. The disgonacleotides of the invention are useful for the prevention and treatment of conditions associated with acyl coenzyme A cholesterol acyltransferase-1, such as disorders involving abnormal lipid or cholesterol metabolism, e.g., atherosclerosis or cardiovascular disease. They are also useful in research and diagnostics for modulating the expression of acyl coenzyme A cholesterol acyltransferase-1
A cholesterol acyltransferase-1 RNA, and were analysed for their effect on acyl coenzyme A cholesterol acyltransferase-1 mRNA levels by quantitative real-time PCR. Acyl coenzyme A cholesterol acyltransferase (ACAT) enzymes catalyse the synthesis of cholesterol actrs from free cholesterol and fatty acyl-CA, and are also involved in regulating the concentration of cellular free sterols. The human acyl coenzyme A cholesterol acyltransferase-1 is the predominant ACAT isoform in the liver, and the gene encoding it is located on chromosome 1q25, although subsequent study has indicated that one acyl coenzyme A cholesterol acyltransferase-1 mRNA is produced from genes on two different
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Microorganism detecting composition comprises dideoxynucleotide triphosphate(s) corresponding to one of four deoxynucleotide triphosphate, and thermally stable polymerase enzyme.

The invention relates to a microorganism detecting composition. The composition is used for detecting a target microorganism. It is used in a bi-directional DNA sequencing method in several contexts including detection of mutations, particularly mutations of medical significance, in samples derived from a human patient, animal, plant, or microorganism, of tamination of fill (human leukocyte antigen) type ancillary to transplant procedures, detection and identification of microorganisms, particularly pathogenic microorganisms, in a sample and in situ is esquencing reactions to produce sequencing fragments within a histological specimen which are then removed from a selected location on the tissue preparation and loaded onto a gel for sequence analysis. The abundance DNA sample: It provides for bi-directional sequencing of DNA which requires combining a complex DNA-containing sample with only a single reaction mixture, thus reducing risk of error and contamination, and increasing the ease with which the procedure can be automatical. 0; and increasing the ease with which the procedure can be automated. The present sequence represents a sequencing primer for identification of a Gaps Sequence 20 BP; 6 A; 1 C; 10 G; 3 T; 0 U; 0 Other; 4.6%; 83.3%; microorganism.

                                    an individual, comprising administering to the individual an oligonucleotide upto 30 nucleotides in length complementary to a nucleic acid molecule encoding human tumor necrosis factor (TMF)-alpha. The method is useful for treating an inflammatory disorder such as inflammatory bowel disease, Crohn's disease, colitis or rhematoid diabetes, pancreatitis, maltiple sclerosis, atopic dermaticis, asthma, and hepatitis in an individual. This sequence represents an antisense oligonucleotide used to modulate expression of tumour necrosis factor alpha (TMF-alpha)
                           The invention describes a method of treating an inflammatory disorder in

The invention relates to a method of treating an inflammatory skin disorder in an individual by topically applying an antisense compound trargeted to a nucleic acid molecule encoding a human B7 protein. The invention is for treating an inflammatory skin disorder in individual. The skin disorder is psoriasis, contact dermatitis, atopic dermatitis, seborrheic dermatitis, nummular dermatitis, generalised exfoliative dermatitis or eczema. The invention effectively modulates critical costimulatory molecules such as the B7 protein. The present sequence represents a human B7-1 targeted oligonucleotide.

e.g. A recombinant adeno-associated virus-vectored ribozyme composition, useful for treating a disease or dysfunction of the mammalian eye e retinal disease, e.g. diabetic retinopathy or age-related macular degeneration.

Example 5; Page 63; 115pp; English.

The present invention describes a recombinant adeno-associated virus (AAV) vectored ribozyme composition (1). (1) comprises: (a) at least a first ribozyme that specifically cleaves an mRNA encoding a protein, polypebtide, or peptide selected from the group of rod opsin, iNOS, RDS/peripherin, VEGFR1, VEGFR2, adenosine A-2B receptor, IGF-1, integrin alpha 1, integrin alpha 3, integrin alpha 5, or integrin alpha V; (b) a vector comprising a polymucleotide encoding the ribozyme, where the polymucleotide operably positioned downstream of at least a first polymucleotide operably positioned downstream of at least a first mammalian cell transformed with the vector; (c) a viral particle comprising the ribozyme or the polymucleotide; (d) an AAV vector comprising the ribozyme or the polymucleotide; (d) an AAV vector

comprising the ribozyme or the polynucleotide. Also described is a method for decreasing the amount of mRNA encoding a selected polypeptide in a retinal cell of a mammalian eye, comprising providing to the eye the composition described above, and for a time effective to specifically cleave the mRNA in the cell. (I) has ophthalmological activity, and can be used in gene therapy. (I) can be used for treating a disease or dysfunction of the mammalian eye, such as a retinal disease or retinal dysfunction. (I) is also useful for manufacturing a medicament for treating the diseases mentioned above, including autosomal dominant retinitis or a blood-retinal barrier dysfunction. (I) can also be useful for treating, decreasing the severity, or ameliorating the symptoms of a pathological condition, e.g. atrophic or pigmented lesions of the eye, blindness, a reduction in central or peripheral vision, or a reduction in central or peripheral vision. . 0 Gaps .. 4.5%; Score 13; DB 1; Length 14; 0; Indels Sequence 14 BP; 3 A; 4 C; 4 G; 0 T; 3 U; 0 Other; Pred. New ribozyme(s) for cleaving cholesterol ester transfer protein mRNA -useful for preventing or treating initial development, progression or regression of vascular diseases, esp. familial hypercholesterolaemia.

Claim 4; Page 42; 72pp; English.

AAT50138-T50359 represent target sequences for the rabbit cholesterol ester transfer protein (CETP) hammerhead (HH) ribozymes (see AAT50360-T50546). CETP is a 74 kD glycoprotein that facilitates neutral lipid transfer between plasma lipoproteins. The numbering of the targets refers

```
to the position of the cleavage site in full length CETP. The ribozyme the binds to 5 nucleotides either side of this site. The ribozymes are able to cleave mRNA from the gene encoding CETP, thereby blocking synthesis and/Or expression of the mRNA. By inhibiting CETP, the reverse cholesterol transport (RCT) pathway can be inhibited (or eliminated) thereby preventing the reduction in size density of the high density conclusions (HDL), prolonging HDL half life, and therefore increasing the lipoproteins (HDL), prolonging HDL half life, and therefore increasing the labormal levels of CETP, specifically atherosclerosis, familial abnormal levels of CETP, specifically atherosclerosis, familial hyperbetalipoproteinaemia, peripheral vascular disease, dyslipidaemia, hyperbetalipoproteinaemia, transplant, atherectomy and angioplastic complications of diabetes, transplant, atherectomy and angioplastic restencis. By inhibiting CETP, the levels of HDL and low density complications of diabetes, transplant, atherectomy and altered (a decrease in LDL) levels, and a corresponding increase in HDL levels). The HT ribozymes can also be used diagnostically to study genetic drift and mutations in diseased cells, and to detect CETP mRNA. As the HH ribozymes cranspet specific regions of the CETP gene, they have low non-specific activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; antilipaemic; neuroprotective; nootropic; genetic variant; APOE; apolipoprotein E; haplotyping; familial dysbetalipoproteinaemia; therapy; genotyping; type III hyperlipoproteinaemia; Alzheimer's disease; atherosclerosis; polymorphism; allele specific oligonucleotide; ASO primer; ss.

Genotyping human apolipoprotein gene of individual for determining haplotype of individual, involves determining identity of nucleotide pair at specific polymorphic sites for two copies of gene.

Lee HH;

Kliem SE, Koshy B,

Choi JY,

WPI; 2002-075064/10.

(GENA-) GENAISSANCE PHARM INC

The patent discloses novel genetic variants of human apolipoprotein E (APOE) gene. The invention also relates to compositions and methods for haplotyping and/or genotyping the APOE gene. The haplotyping methods of the invention are useful for improving the efficacy and reliability of

Claim 16; Page 14; 78pp; English.

```
The sequences given in AAQ48323-33 are primers which were used in the cloning of the heavy (H) and light (L) chains of the antihuman interleukin-4 (IL-4) monoclonal antibody (MAD) 25D2. The complementarity determining regions (CDRs) of this antibody may be grafted onto a human antibody to produce a humanised antibody. It may also be desirable to include one or more amino acid residues which, while outside the CDRs, are likely to interact with the CDRs or IL-4. These sequences may also be used to produce single chain IL-4 binding proteins comprising linked heavy and light chain fragments of the Fv region, or biosynthetic antibody binding sites. The humanised MAD is an IL-4 antagonist. It may
diseases associated with APOE activity, e.g. familial dysbetalioproteinaemia, type III hyperlipoproteinaemia, atherosclerosis, and Alzheinaemia type III hyperlipoproteinaemia, atherosclerosis, and Alzheinaer's disease. They are useful to validate APOE as a candidate associated with APOE activity and in the design of clinical trials of candidate drugs for treating a specific condition or disease predicted to be associated with APOE activity. Genotyping or haplotyping methods are useful to screen for compounds targeting APOE to treat a specific condition or disease associated with APOE activity. The present DNA sequence is an allele specific oligonucleotide (ASO) primer which is used
                                                                                                                                                                                                                                                                                                         0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CDRs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Heavy; VH; light; VL; chain; variable region; antihuman; interleukin-4; IL-4; monoclonal antibody; MAb; 25D2; single chain binding protein; complementarity determining region; CDR; humanised; Fv region; BABS; antagonist; polymerase chain reaction; PCR; primer; amplify; ss.
                                                                                                                                                                                                                                                                                                         Gaps

AAX09121-X10268 are allele-specific oligonuclectide primers used in the isolation of various biallelic polymorphic markers found in the human genome (represented in AAX10269-X12337). These primers can be used in a certain etchod for determining polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, familial hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary conformination cancer, diseases of the nervous syndrome, osteogenesis imperfecta, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such as longevity, appearance (e.g. baldness, obesity), strength, speed, endurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid conventibility and sused to produce medicaments for the treatment or morn'n avis of enth or produce medicaments for the treatment or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity (e.g. ribozymes) which are capable of modulating the expression of plant genes: (i) involved in biosynthesis of alkaloids; or (ii) involved in flower formation. AAV95382 to AAV96334, and AAV96335 to AAV96354 represent potato solanidine glucosyltransferase hammerhead and hairpin ribozymes, respectively. AAV95629 to AAV95381, and AAV96355 to AAV96773 to AAV97710, and AAV97711 to AAV97195 represent potato colanidine glucosyltransferase target sequences. AAV96773 to AAV97710, and AAV97710 to AAV97195 represent potato citrate synthase hammerhead and hairpin ribozymes, respectively. AAV96735 to AAV96773, and AAV97710 to AAV97710 contact of this the synthase sequences. Ribozymes of the present invention can be used to inhibit the synthesis of toxic alkaloids in solanaceous plants, to inhibit flowering in potato, lettuce, spinach, cabage, brussel sprouts, arugula, kale, collards, chard, beet, turnip, sweet potato and turf grass. Also the ribozymes can be used for RNA manipulation in the same way that restriction endonucleases are for DNA, as well as to examine genetic drift and mutations in plants and to detect specific RNA. The ribozymes can be targeted to specific genes or to consensus sequences ribozymes can be targeted to specific genes or to consensus sequences or the restriction and plants and to detect specific RNA. The ribozymes can be targeted to specific genes or to consensus sequences or the ribozymes, and being catalytic need to be present
                                      Solanidine; glucosyltransferase; potato; citrate synthase; target; hammerhead ribozyme; hairpin ribozyme; alkaloid biosynthesis; flower formation; cleavage; solanaceous plant; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New enzymatic nucleic acid(s) - useful for, e.g. reducing alkaloid
Potato citrate synthase target sequence position 1383.

Solanidine; glucosyltransferase; potato; citrate synthase; target;

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity (e.g. ribozymes) which are capable of modulating the expression of plant genes: (i) involved in blosynthesis of alkaloids; or (ii) involved in flower formation. AAV95382 to AAV95334, and AAV96335 to AAV96354 represent potato solanidine glucosyltransferase hammerhead and hairpin ribozymes, respectively. AAV95629 to AAV95391, and AAV96335 to AAV96734 represent potato solanidine glucosyltransferase target concess. AAV9673 to AAV97170, and AAV97171 to AAV97195 represent contrate synthase hammerhead and hairpin ribozymes, respectively. CC potato citrate synthase target sequences. Ribozymes of the present potato citrate cynthase target sequences. Ribozymes of the present invention can be used cynthase target sequences. Ribozymes of the present invention can be used to inhibit thowering in potato, lettuce, spinach, cabbage, brussel sprouts, arugula, kale, collards, chard, beet, turnip, sweet potato and turf crimibit kale, collards, chard, beet, turnip, sweet potato and turf craugular can muterions in plants and to detect spotato and turf craugular than muterions in plants and to detect specific genes cribozymes can be targeted to specific genes or to consensus sequences within a family of related genes, and being catalytic need to be present consensus and turk at only very low concentrations. The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment at least 80 % identity to the 17 mer sequence, a sequence that conditions from the component of alignment of them, or the corresponding RNA. The novel isolated nucleic of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for derecting, identifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, containing the nucleic acids, cells containing the polypeptides, vectors containing the nucleic acids, cells containing the polypeptides in paracterised by development of tumours or cell diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and containing the superior prognosis of these can also be used to generate antibodies, and both the polypeptides can also be used to generate antibodies, and both the meaning of protein and antibodies are useful as components of protein
New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           μουμ τηε polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .;

Tumour suppression/reversion associated nucleotide #4982.

cytostatic; antiviral; neuroprotective; nootropic; neuroleptic; ss; primer; probe; tumour suppression; tumour reversion; apoptosis; virus resistance; transgenic animals; Alzheimer's disease; schizophrenia; diagnosis.

Homo sapiens

```
The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides. The nucleotides are used as probes or primers for detecting, clentifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as crecombinant polypeptides, and to prepare transgenic animals, as corperimental models. The nucleotides (also vectors containing them and calls containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or viral infections of fise nucleotides can be used for disagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can also be used to screen for their specific interactive molecules, conversing the nucleotide interactive molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antisense oligonucleotides, useful for inhibiting human Fas-associated death domain (FAUD) expression are targeted to the 3' untranslated region of the FADD gene.
                                                                                                                                                                                                                                                                 variable domains contraining anolfied complementarity determining regions (CDRs) carrying a cysteine nose and which have cytokine agoinst and anagonist mechanisms of action. The method of the invention can be used to obtain peptide ligand mimetics capable of binding a target antigen. The binding members may also be used to provide agonists or antagonists of targets such as cytokines. In particular specific binding members for MIP-1 alpha receptors are useful for treatment of HIV infection and for in vitro investigation of mechanisms of HIV infection. A selection of peptide ligand mimetics from CDR3 cysteine nose libraries provide a means to select a different and potentially more effective population of peptide ligands than direct display of similar cysteine nose ligands on the surface of bacteriophage. The products of the invention have anti-HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                FADD; human; antisense; inhibitor; Fas-associated death domain; primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                      This invention describes the construction of libraries of antibody

This invention describes novel antisense oligonucleotides (OGNs) (I) 8-20 nucleotides in length that specifically hybridize with and inhibit incleic acids encoding human Fas-associated death domain (FADD), targeted to the 3' untranslated region (3'VTR). (I) can be used to treat animals, especially humans, suspected of having or being prone to a disease or condition associated with FADD expression. AAZ44746-Z44831 represent primers and probes used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention provides antisense compounds capable of inhibiting the expression of human Her-3, a member of epidermal growth factor (EGF) family of receptor/tyrosine kinases. The antisense oligonucleotides are useful for inhibiting the expression of Her-3 in cells or tissues. They are commonly used as research reagents and in diagnostics for example, to elucidate the function of particular genes. The antisense compounds are also useful for distinguishing between functions of various members of a biological pathway and for research use. They are also utilized for diagnostics, therapeutics, prophylaxis and in kits. They are useful prophylaxically, e.g. to prevent or delay infection, inflammation or tumor formation. Sequences AH47532-47615 represent chimeric antisense phosphorothioate oligonucleotides having 2'-MOE wings and a deoxy gap,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antisense compounds capable of modulating expression of human Her-3, member of epidermal growth factor family of receptor/tyrosine kinases, useful for preventing or delaying infection, inflammation or tumor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Her-3; epidermal growth factor; BGF; receptor/tyrosine kinase; human; antiinflammatory; cytostatic; antibacterial; antisense; ss.

The method comprises amplifying a target nucleic acid having at least one accessible and one inaccessible site. Primers that form an extension product are identified as the oligonucleotides which can interact with the folded target nucleic acid. Oligonucleotides from the present invention can be used in novel detection methods for clinical diagnostic purposes, including the detection and identification of pathogenic organisms (e.g. HIV). The method allows the ability to rapidly analyse nucleic acid structures. ABL46034 to ABL46367 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identifying oligonuclectides hybridizing to nucleic acids containing secondary structure, useful in clinical diagnosis, comprises identifying primers that interact with the target to form an extension product under amplification conditions.
                                                                                                                                                                                                                                                                                                                               Nucleic acid accessible hybridisation site, detection, hybridisation, characterisation, identification, nucleic acid structure; diagnosis;

It is used in a method for the prodn. of RFLP fragments for an HLA locus, together with a second primer making up a locus-specific primer (LSP) pair. It is pref. used with a Class I-specific primer which hybridises with at least two different Class I loci, pref. at least one of each of hybridises with intervening sequence (IVS) III or IVS I sequences. Direct determination of the haplotye is possible, providing useful information for identity of individuals for e.g. paternity case and forensic investigations. See also AAQ10621-Q10669. The sequences given in AAQ39288-303 are primers and probes which were used in a method to detect a mutation in the glucocerebrosidase gene, corresponding to an insertion of a G nucleotide adjacent to base 57 of exon 2 (see also AAQ39287 and AAQ39304). The template DNA used was isolated from peripheral blood leukocytes. Glucocerebrosidase is an enzyme which is required for the lysosomal degradation of glycolipids (see also AAQ39266). A deficiency of this enzyme leads to Gaucher disease, as in the absence of glucocerebrosidase, the extremely insoluble glucosylceramide (glucocerebroside) accumulates. The insertion of a G nucleotide adjacent to position 84 in the glucocere- brosidase cDNA has been characterised as a new Gaucher disease causing mutation. The corresponding position of this mutation in the gluco- cerebrosidase gene is in exon 2, adjacent to position 57. (Updated on 25-MAR-2003 to correct
                                                                                                                                                                                                                                                                        Screening method for new Gauche disease mutation - comprises inserting guanine nucleotide adjacent to specified position of gluco-cerebrosidase gene-exon 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Mutant; polymerase chain reaction; IVS2+1; 84GG; 1226G; 1448C; screening method; detection; GC alleles; Gaucher's disease; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a collection of binding groups for a family of nucleic acids comprising members of relative high and relative low significance, where the binding groups are selected to be capable to identify, alone or in combination, essentially all members of the family of nucleic acids of relatively high significance. The collection of binding groups is useful for typing of nucleic acid in a clinical sample, by contacting the nucleic acid with the collection and determining whether one or more binding groups bound to the nucleic acid of the sample. This method is useful for determining whether the sample comprises at least a part of a member of relatively high significance of diagnosting the severity of a disease caused by a pathogen containing a member of a family of nucleic acids. The collection of binding groups is useful for dispensing the severity of a disease caused by a pathogen containing a member of a family of nucleic acids. ABL893Ty to ABL893I represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Collection of binding groups for determining or typing samples, especially clinical samples, has groups capable to identify essentially all members of the family of nucleic acids of relatively high significance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Glucocerebrosidase; peripheral blood leukocyte; lysosomal degradation; glycolipid; Gaucher disease; glucosylceramide; glucocerebroside; RFLP; restriction fragment length polymorphism; mutation; pseudogene; 1226G; Jewish; 1448C; polymerase chain reaction; PCR; primer; probe; ss.

and that fragments of the above mRNA can independently regulate

sugar and that fragments of the above mRNA can mRNA accumulation in a sugar responsive manner

```
The sequence is that of the second 3' PCR primer which was used in a polymerase chain reaction amplification as part of a screening method for the detection of multiple glucocerebrosidase mutations IVS2+1, exon 2 nt 57G (84GG), exon 9 nt 2G (1226G) and exon 10 nt 60C (1448C). This method may be used for screening humans for GC alleles associated with Gaucher's disease. It can be used to diagnose either the disease itself or a heterozygous carrier state. (Updated on 25-MAR-2003 to correct PN field.)
                                                Detection of Gaucher's disease - by screening DNA for a substitution of adenine for guanine at position 1 of gluco:cerebrosidase gene intron 2.
                                                                                                                                                                                                                                                                                                                                                                                        Sequence 20 BP; 4 A; 8 C; 3 G; 5 T; 0 U; 0 Other;

New expression vector comprising promoter capable of directing expression of a coding sequence in angiosperm cell.

Example 2; Page 8; 21pp; English.

capable of directing expression of a coding sequence in an angiosperm cell, and a 3' untranslated region of a rice alpha-amylase gene where after the coding sequences is inserted into the vector, the 3' untranslated region and the coding sequence are transcribed into a single mRNA. 3' untranslated regions of rice alpha-amylase gene can cis-regulate especially for gene expression regulation in plants, responsive manner especially for gene expression regulation in plants, respensating tissue or even regenerating a whole plant. The full length 3' untranslated region of a rice alpha-amylase gene (alphaAMY3) enhances mRNA stability in the absence of sugar and promotes mRNA degradation in the presence of This invention describes a novel expression vector comprising a promoter

The invention describes a compound, 8-50 mucleobases in length targeted to a nucleic acid molecule encoding human TERT (telomerase reverse transcriptase), where the compound specifically hybridises with and inhibits the expression of TERT. A series of oligonucleotides were designed to target different regions of the human TERT RNA. These were 20 nucleotides in length and composed of a central gap region consisting of the nucleotide wings. The wings were composed of 2' methoxyethyl (2'-MOE) nucleotide wings. The wings were composed of 2' methoxyethyl (2'-MOE) nucleotide wings. The variance transcriptase (RT)-polymerase chain reaction (PCR). The compound is useful for inhibiting the expression of TERT in cells or tissues, for treating a human having disease or condition associated with TERT, for modulating apoptosis, for inhibiting cell growth (preferably, cancer cell growth), in antisense therapy and for diagnostics and therapeutics. This sequence is an antisense oligonucleotide used to modulate the activity of nucleic acid molecules
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New compound targeted to nucleic acid molecule encoding telomerase transcriptase (TERT), which specifically hybridizes with and inhibits expression of TERT, useful for modulating apoptosis and inhibiting cell
                                                                        Telomerase reverse transcriptase, TERT, cytostatic, apoptosis, cell growth inhibitor, antisense oligonucleotide, antisense technology,
                                Telomerase reverse transcriptase, antisense oligonucleotide #11.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       encoding TERT, described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 20 BP; 6 A; 10 C; 4 G; 0 T; 0 U; 0 Other;

Capture oligonucleptide Zip ID#2403 oligo #9. (first entry) 16-FEB-2002 ABI95316; 

Human; K-ras; PCR primer; probe; capture probe; mutation detection;

The present invention describes a method (MI) for despitation describes a method (MI) in present invention describes a method (MI) in the describing temperatures within a narrow trange. The method is useful of or detecting infectious diseases caused by bacterial infectious agents of for detecting infectious diseases caused by bacterial infectious agents of a Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents of Cryptococcus neoformans, Candida albicans and special infectious agents of Cryptococcus neoformans, Candida albicans and compensional fundatures, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and polio virus, and parasitic infectious agents selected from Onchoverva volvulus, Entamoeba histolytica and Dracunculus consists. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obssity defects.

CC Detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amphilitation, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring for environmental monitoring cand the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the computer of particular sites and identifying if ligation of the oligonucleotide probe sets occurred and correlating (using a computer) identified ligation to a presence of the target uncleotide sequences. ```
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nuclectides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or mallignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of denosine of, or reducing sensitivity to adenosine, reducing levels of defension lung antifarmation, lung allergies, or a respiratory disease or condition, lung allergies, or a respiratory disease or condition.

Note: The sequence data for this patent is not represented in the printed security in the was obtained in electronic format directly from WIPO or the control or the patent of the control or the cont
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

This is a stromelysin mRNA target sequence (nucleotide no. 725) of an enzymatic RNA molecule (ribozyme) which cleaves mRNA associated with the development or maintenance of osteoarthritis or other pathological conditions which are mediated by metalloproteinase activation. The concn. of the ribozyme necessary to effect a therapeutic treatment is lower than that of an antisense oligonucleotide and the specificity of action is higher. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The present invention describes a novel enzymatic nucleic acid (ENA)

can having a hammerhead motif (HM) comprising: (i) at least 5 ribose residues

can inhibit a 2'-C-allyl modification at position 4 of the ENA; (iii) at least

can inhibit collagenase and stromelysin production in the synovial

can inhibit collagenase and stromelysin production in the synovial

can inhibit collagenase and stromelysin production in the synovial

can inhibit collagenase and stromelysin production of arthritis.

CC particularly osteoarthritis or rheumatoid arthritis. The ENA's can also

be used to treat antigen presenting cells of a donor to induce tolerance

con a maloantigen of a donor. They can also be used for

chancing graft tolerance or for treating autoimmune disease, and for

creating allergies and other inflammatory conditions. The ENA's can also

consequing allergies and other inflammatory conditions. The ENA's can also

consequing allergies and other inflammatory conditions of the expression of

stromelysin without introducing the non-specific effects upon gene

concentration of ribozyme required to affect a therapeutic treatment

concentration present sequence is used in the exemplification of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0
                                                                                                                                                                                                                                                                                 The sequences AAQ93462-Q93494 are examples of target cleavage sequences for a hammerhead ribozyme with sequence motif AAQ90451. A ribozyme, pref. hammerhead, hairpin, hepptitis delta virus, group 1 intron or RNAse P RNA motif can be used in a composition for the treatment of arthritis, cancer or angiogenesis. The ribozyme comprises between 5-45 bases complementary to the target mRNA. The ribozymes (see AAQ93830-51 for examples) were synthesised based on putative stromelysin mRNA target cleavage sequences (AAQ93496-Q93829). (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Arthritic condition; graft tolerance; immune response; target; cleavage; hammerhead ribozyme; hairpin ribozyme; humman; rabbit; mouse; collagenase; stromelysin; synovial membrane; joint; arthritis; osteoarthritis; rheumatoid arthritis; autoimnune disease; allergy; inflammation;

```

This sequence represents a probe for the omega-conotoxins of Conus magus.
This sequence was based on a fragment of the conotoxins MVIIA and MVIIB,
to isolate the MVIIC conotoxins of the invention (see AAM12804).
Comus venom contains three types of disulphide rich peptides, these are the alpha-conotoxins mu-conotoxins and omega-conotoxins. The alphaconotoxins target and block the nicotinic acetylcholine receptors, the mu-conotoxins target and block the presynaptic neuronal calcium conotoxins target and block the presynaptic neuronal calcium conotoxins target and block the presynaptic neuronal calcium con channels. The omega-conotoxin peptides of the invention can target plike subtypes of calcium ion channels, as well as the N-type channels of cistinguishing them from previously known omega-conotoxins). The peptide sequences can also be used for distinguishing the types of calcium ion channels. The presence of sites for the peptides can be determined in tissue sections, thereby characterising calcium ion channel expressing cells into various types. As the conotoxin peptides affect the canotomities in respiratory control which are particularly severe in the neonatal period. The peptides can also be used for assessing neural developmental syndromes that result in respiratory crisis, and can be conserved.

```
The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl hydrocarbon nuclear transporter (ARNY) gene, an integrin subunit bete 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17167 and AAA17661 to AAA1762 represent ribozyme sequences for ANTY, corresponding target sequences, AAA17684 represent their corresponding target sequences, AAA19154 represent ribozyme sequences, AAA19154 represent ribozyme sequences, C. AAA19154 represent ribozyme sequences, AAA19154 represent ribozyme sequences, AAA19221 to AAA21922 represent their corresponding target sequences; C. AAA19223 to AAA2022 represent their corresponding target sequences; AAA15223 to AAA21689 to AAA21680 and AAA21680 to AAA21680 to AAA21680 to AAA21680 and AAA21680 to AAA21680 to AAA21680 to AAA21680 to AAA21680 to AAA21680 and AAA21680 to AAA21840 to AAA21840 to AAA21840 to AAA21840 to AAA2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; c-raf; A-raf; B-raf; hammerhead ribozyme; hairpin ribozyme;

The present invention describes nucleic acids (A) that interact stably with a target sequence and contain at least one phosphoro(di)thioate with a target sequence and contain at least one phosphoro(di)thioate with a target sequence and contain at least one phosphoro(di)thioate link, having endonuclease activity. (A), and more generally any catalytic nucleic acid (A') that modulates expression of the oestrogen receptor contains or transforming cells as vivo and implanting treated cells, or for other conditions associated with levels of oestrogen receptor.

CC genuse of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with alterations in phenotype, correlate inhibition of gene expression with alterations in phenotype, correlate inhibition of gene expression with alterations in phenotype, correlate inhibition of gene expression with alterations in (A) improves reagents (for RNA, in the same way that restriction endonucleases are used with DNA). The combination of modifications in (A) improves the captering to AAA21015 represent oestrogen receptor hairs incomparate sequences.

CC AAA2474 represent oestrogen receptor hairspin ribozyme sequences.

CAAA2474 and AAA26105 represent their corresponding target sequences and sequences.

CC AAA2593 to AAAA26105 represent their corresponding target sequences and antisense oligonucleotides used in the exemplification of the present Single nucleotide polymorphism; SNP; human; genetic disease; disease susceptibility; cardiovascular system; endocrine system; neurological system; forensic testing; paternity testing; PCR primer; ss. capable of modulating a process in a biological system. The method
capable of modulating a process in a biological system. The method
comprises: (a) introducing into the system a random library of nucleic
confidence and a catalytic domain (CD); and (b) identifying NAC
a random sequence, and a catalytic domain (CD); and (b) identifying NAC
in systems where modulation has occurred and/or determining the sequence
of at least part of the SBDs in such systems. Nucleic acid molecules with
condonuclease activity and catalytic activity, from the present invention,
care used to modulate gene expression in plant and mammalian cells and to
cleave target nucleic acid, particularly for treating systemic diseases
caused by specific RNA, e.g. cancer, inflammation, psoriamis, non-hepptic
ascites and infection. They may also be used to detect genetic drift and
cutations in diseased cells and to determine c-raf RNA. Specifically NACs
with RNA-cleaving activity that modulate expression of the Raf gene, are
used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or
generally any condition associated with the level of c-raf. Introduction
of sugar/phosphate modifications increases stability against nuclease and
activity. AAV90922 to AAV3877 represent NACs that can be used in the
cativity. AAV90922 to AAV3877 represent NACs that can be used in the ó Identifying new catalytic nucleic acid that modulates selected processes - especially ribozymes that cleave Raf RNA for treating cancer, restenosis, and also new ribozymes and modified nucleoside triphosphates Oestrogen receptor hammerhead ribozyme target sequence SEQ ID NO:2178. The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocatine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
Nucleic acid selected from one of 106 genes comprising single nucleotide polymorphisms, allele-specific oligonucleotides to the genes are useful for phenotypic correlations, forensics, paternity testing, medicine and

Nucleic acid selected from one of 106 genes comprising single nucleotide polymorphisms, allele-specific oligonucleotides to the genes are useful for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis

nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual s susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's

The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human

These may be antisense or ribozyme sequences, and are useful in the treatment of diseases associated with conditions affected by Chk1 levels, including cancer. The present sequence is an oligonucleotide described in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel nucleic acid molecule e.g., ribozymes or antisense nucleic acid molecules, which downregulates expression of a checkpoint kinase-1 gene, useful for treating colorectal, lung, breast or prostate cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

Synthetic.

The invention relates to a nucleic acid molecule which down regulates corpusession of a CD20 gene and a nucleic acid molecule which down reguression of a neurite growth inhibitor gene (NGGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a merzyme (cleaving RNA with an NGM motif) a zinzyme (cleaving RNA with a NGM triplet), a zinzyme (cleaving RNA with a NGM triplet), a zinzyme (cleaving RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably MG² +. CC CD20 in the presence of a divalent cation that is preferably MG² +. CC FCD20 in the presence of a divalent cation that is preferably MG² +. CC FCD20. The treatment may further comprise the use of one or more creat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-Hodgkin's lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-Hodgkin's lymphoma (MLD), bulky low-grade or follicular non-Hodgkin's lymphoma (MLD), immunocytoma (IMC), small B-cell lymphocytic lymphoma, immunodeficiency virus) associated NHL, mantle-cell lymphoma (MCD), immunocytoma (IMC), small B-cell lymphocytic lymphoma, immunocytoma (IMC), small B-cell lymphocytic lymphocytic cc targetting nucleic acid may be contacted with a cell to reduce NOGO activity of the nucleic acid may be contacted with a cell to reduce NOGO activity of the contacted with a contacted with a coll acid was of one or more coll and treat a patient having a condition associated disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NOGO expression. The present sequence is a DNAzyme molecule of the invention

therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-leukaemia, Brymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell lymphoma (NCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, immune thrombocytopaenia, and inflammatory arthropathy. The NoGO-presence of a divalent cation that is preferably MG2*. Furthermore, the nucleic acid may be contacted with a cell to reduce NoGO activity of the NoGO-matera a patient having a condition associated with the level of NoGO. The treatment may further comprise the use of one or more
                                                                                                                                                                                                                                      therapies. In particular, the NGGO-tergetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CNA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NOGO expression. The present

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGOD). The regulates expression of a neurite growth inhibitor gene (NGOD). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acid cleaving an RNA motif) prosessing an NGH motif), a G-cleaver (cleaving RNA with a NYM motif) prosessing an NGH motif), a G-cleaver (cleaving RNA with a NYM motif) prosessing an NGH motif), a G-cleaver (cleaving RNA with a NYM motif) prosessing an NGH motif), a divalent cation that is preferably Mg<sup>2</sup>/+.

Cof CD20 in the presence of a divalent cation that is preferably Mg<sup>2</sup>/+.

Cof CD20. The treatment may further comprise the use of one or more cof CD20. The treatment may further comprise the use of one or more cof CD20. The treatment may further comprise the use of one or more creat lymphoma, laukaemia, H2 (human immunodeficiency virus) associated with the level cortargement, a lymphoma (NCI), immunocytoma (NCI), small B-cell lymphocytic lymphoma, cortargetting nucleic acid is used to cleave RNA of the NCOC cargetting nucleic acid may be contacted with a cell to reduce NOGO activity of the cortargettent may further comprise the use of one or more cell and treatment may further comprise the use of one or more therapies. In particular, the NOGO-targetting nucleic acid may be used to treat central nervous system (CNA, stroke), Alzheimer's disease, dementia, multiple sclerosis (ALS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), chemotherapy-induced neuropathy, and/or other neuropathy and/or other neuropat
                                                                                 Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               which respond to the modulation of NOGO expression. The present

Long human Tumour Endothelial Marker SEQ ID NO 323.

Human; mouse; rat; TEM; tumour endothelial marker; NEM; PEM; cytostatic; normal endothelial marker; pan-endothelial marker; immunostimulant; antiangiogenic; tumour; neoangiogenesis; vascularised tumour; polycystic kidney disease; diabetes; retinopathy; rheumatoid arthritis; psoriasis; ss.

Homo sapiens.

WO200210217-A2

```
The invention relates to an isolated molecule comprising an antibody variable region which specifically binds to an extracellular domain of a tumour endothelial marker (TEM) protein selected from ABB90732, ABB90740, ABB90740, ABB90740, ABB90740, ABB90740, ABB90740, ABB90740, ABB90740, ABB90749, They are useful for inhibiting tumour growth, neoangiogenesis in subjects bearing a vascularised tumour, polycystic kidney disease, diabetic retinopathy, rheumatoid arthritis and psoriasis Human, mouse and rat TEM genes and the encoded proteins (ABL92075-ABL92141 and ABB90721-ABB90789) are disclosed, as are marker oligonucleotide sequences: tumour endothelial markers (TEM) ABL91996-ABL92014; and ABL92191; normal endothelial markers (TEM) ABL92092-ABL92074; and pan-endothelial markers (PEM) ABL92092-ABL92074; and pan-endothelial markers oligonucleotide marker useful to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, genome-derived myosin-like protein 1, GDMLP-1, hGDMLP-1, heart, muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polymuclectide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as the respective supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polymucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromsome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence and the exemplification of the present invention. N.B. ```
The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 (an be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 mucleic acids in samples, as amplification substrates, to compare initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunospens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specifically of hGDMLP proteins, as specific biomolecule and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desoribic obinication, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The concentration of skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New polypeptide, for raising antibodies that recognize hGDWLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDWLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Shannon ME;

The protein and polynuclectide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 cands can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP-1 proteins, as specific biomolecule capture probes for surface-enhanced laser describing in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The polymucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart may resent a manual production and subsociated with the expression of hGDMLP-1, in particular heart may resent associated with the characteristics and skeletal manual endiagnosing a characteristic and skeletal manual endiagnosing and skeletal manual endiagnosing a production and in vaccines of hGDMLP-1 is localised to chromosome 22.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser descrption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents an oligomer used in the screening of the hGDWLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence

The present invention describes a human genome-derived myosin-like

protein 1 (hGDMLP-1). The protein and polymocleotide sequences of hGDMLP-

1 can be used in gene therapy and vaccine production. The hGDMLP-1

nucleic acids can be used as probes to detect, characterise and quantify

hGDMLP-1 nucleic acids in samples, as amplification substrates, to

provide initial substrates for the recombinant engineering of hGDMLP-1

protein variants having desired phenotypic improvements, and for

expressing the proteins. The hGDMLP-1 proteins or polypeptides may be

used as immunogens to raise antibodies that specifically recognise hGDMLP-

cused as immunogens to raise antibodies that specifically recognise hGDMLP-

cused as immunogens to raise antibodies that specifically recognise hGDMLP-

cused as immunogens to raise antibodies that specifically recognise hGDMLP-

cused as immunogens to raise antibodies that specific blomolecule

and/or amount specifically of hGDMLP proteins, as specific blomolecule

complure probes for surface-enhanced laser describin in injection, and in vaccines or for replacement therapy. The

production, and in vaccines or for replacement therapy. The

production, and in vaccines or for replacement therapy. The

condition and in vaccines or for replacement therapy. The

production and in vaccines or for hard for diagnosing a

disporder associated with the expression of hGDMLP-1, in particular heart

and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                 Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

The present sequence represents an oligomer used in the screening of the hGDWLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence

```

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98559 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was import or human chromosome 10pl2.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of Example 2; Page 269; 718pp; English

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was mapped to human chromosome 10p12.1. HTPL and its coding sequence are

such disorder associated with decreased expression or activity of human HTPL. Such disorders include disorders of festis, or afteral, adult and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are cilically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention

useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention
      8x33333333x8
